1. FUNCTION: GRANULINS HAYE POSSIBLE CYTOKINE-LIKE ACTIVITY. THEY MAX. PLAX A ROLE IN INTLAMMATION, WOUND REPAIR, AND TISSUE REMODELING.

CELL LINE AA3 IN COUTURE WHILE GRANULIN B ACTS AS AN ANTAGONIST.

TO GRANULIN A, INHIBITING THE GROWTH.

C -1- FUNCTION: GRANULIN A, INHIBITING THE GROWTH.

C -1- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be produced by alternative splicing.

C -1- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be produced by alternative splicing.

C -1- TISSUE SPECIFICITY: IN WIELOGENOUS LEUKEMIC CELL LINES OF PROMONOCYTIC, PROWYELOCYTIC, AND PROERTHELIAL CELL LINES. PRESENT CC IN INFLAMMATORY CELLS AND BORE MARROW. HIGHEST LEVELS IN KIDNEY.

C -1- PTM: GRANULINS ARE DISULFIDE BRIDGED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        POTENTIAL.

                                    Bateman A., Belcourt D.R., Bennett H.P., Lazure C., Solomon S., Granulins, a novel class of peptide from leukocytes. F. Biochem. Biophys. Res. Commun. 173:1161-1168(1990).

-i- FUNCTION: GRANULINS HAYE POSSIBLE CYTORINE-LIKE ACTIVITY. THEY MAY PLAY A ROLE IN INTEMMATION, WOUND REPAIR, AND TISSUE REMODELING.

-I- TISSUE SPECIFICITY: UBIQUITOUS, MOST ABUNDANT IN THE SPLEEN AND SEVERAL TISSUES OF ENDOCRINE SIGNIFICANCE.

-1- FUNCTION: GRANULINS HAVE POSSIBLE CYTOKINE-LIKE ACTIVITY. THEY MA
PLAY A ROLE IN INRIAMMATION, WONND REPAIR, AND TISSUE REMODELING-
-1- TISSUE SPECIFICITY: UBIQUITOUS.
-1- PTM: GRANULINS ARE DISULFIDE BRIDGED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (POTENTIAL). THIS METABOLITE HAS PROFOCUND EFFECTS ON VERTEBRATE DEVELOPHENT. RETINOIC ACID IS A MORPHOGEN AND IS A POWERFUL TERATOGEN. THIS RECEPTOR CONTROLS CELLS FUNCTIONS BY DIRECTLY REGULATING GENE EXPRESSION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chatterjee K.K.; raid of the retinoic acid receptor-alpha "Isolation and characterization of the retinoic acid receptor-alpha gene in the Japanese pufferfish, F. rubripes."; Gene 236:315-323(1999).

CENTRAL FOLD IN MEDIATING PROMOTER RESPONSES TO VARIOUS ACTIVATORS AND REPRESSORS.

INTERACTS WITH TAFIL 40.

-I- SUBDUIT: FIPID IS COMPOSED OF TATA BINDING PROTEIN (TBP) AND A NUMBER OF TBP-ASSOCIATED FACTORS (TAFS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE-20057165; PubMed-10591208; Brusklewich R., Beare D.M., Clamp M., Smink L.J., Ainscough R., Ainelda J.P., Babage A.K., Bagguley C., Bailey J., Barlow K.F., Bates K.N., Beasley O.P., Balkey S.E., Bridgeman A.M., Buck D., Burgess J., Burtli W.D., Button J., Carder C., Carter N.P., Chen Y., Clark G., Clegg S.M., Cobley V.E., Cole C.G., Collier R.E., Connor R., Conroy D., Corby N.R., Coville G.J., Cox A.V., Davis J.D.
